(54) Demand apnea control.

(57) An apparatus for the control of both central and obstructive sleep apnea using electrical stimulation on a demand basis. Implantable sensors (44,46) monitor the respiration cycle and determine the occurrence of apnea events. Sensing means (76,92,82) sense central apnea by the passage of an escape interval of time without the sensing of an inspiratory event. Obstructive sleep apnea is sensed by a sensing means (78) as an abnormal pressure differential across the airway. The diaphragm is electrically stimulated by a stimulating means (98,104,54) upon sensing of central apnea. The musculature of the upper airway is electrically stimulated by a stimulating means (100,102,52) upon sensing of an occurrence of obstructive sleep apnea. Stimulation of the upper airway is provided whenever central apnea is sensed.
